Module Description

Each final year student is required to undertake a project that involves investigation into a specific research topic in some aspect of Pharmacy/Biomedical Sciences. This can take the form of a literature based review or a small scale questionnaire-based epidemiological study.

It is intended that the project should be focused and include research methodology and critical assessment of the material. Each student will be assigned to a supervisor who will provide the topical framework for a suggested study. These determinants will take into account the selected group of elective courses studied in previous semesters. The student will be encouraged to formulate their own ideas. The aims/objectives will be formulated jointly with their supervisors.
