Module Description

This pathophysiology provision introduces pharmacy students to the mechanisms of disease-states based on the basic knowledge of body structure and function they have learned in previous courses. It deals with derangement of natural body functions and the natural response of the body to diseases at the systems level. Specific diseases of different body systems will be discussed to illustrate these principles. This is specifically synchronized with the offering of pharmacology and biochemistry so as to constitute an integrated system describing how the disease occurs and drug points of intervention.
