Module Description

This is an introductory pharmacology course for the 3rd year pharmacy students. The course is designed so that students gain understanding on the principles of drug action, main pharmacodynamics (what the drug does to body) and pharmacokinetics (what the body does to drug). Essentially, students will thoroughly study drug actions on the autonomic nervous system, neuromuscular junction, renal and cardiovascular systems; and their therapeutic uses therein. This foundation is crucial for subsequent understanding of drug actions on various body systems, to be studied in pharmacology, clinical pharmacy and pharmacotherapy.
