Module Description

The course aims to increase the clinical knowledge about neuropsychiatric disorders (affective & anxiety disorders, Parkinsonism, dystonia, extrapyramidal, seizure and epilepsy disorders, and coma), peptic ulcer disease and hepatic disorders (jaundice, chronic hepatitis, viral & non-viral hepatitis, as well as their complications, hepatic encephalopathy, portal hypertension, ascites & hepato-renal syndrome) to help the student to be an effective member of the health team strategy. It promotes the student's ability to identify problems and to reach logical decisions taking into account the patient's history of medications as well as patient education about the nature of their diseases, possible complications, drug administration, precaution and importance of compliance. For a specific disease state, the student should recognize possible drug interactions, managing and monitoring adverse drug reactions.
